

8 · Emergent depth matches the required receptive field

task: fire iff two spikes are exactly distance s apart $\rightarrow$ a unit must SEE BOTH $\rightarrow$ depth $\geq s/2$

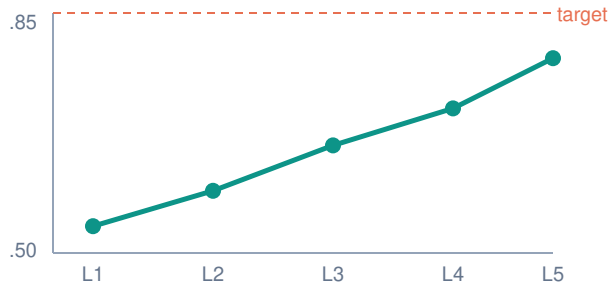

input ($s = 8$)

$L=1$ RF: misses

$L \approx s/2$ RF: sees the pair

accuracy vs stack depth ($s=8$)

Chance until the stack is deep enough to cover the pair, then accuracy lifts off at $L \approx s/2$. Larger $s \rightarrow$ deeper stack selected.
