

The operators: $A \Rightarrow B$, and exactly what each one does

structure before (grey) — operator (orange) — structure after (teal)

dense seed

PRUNE

remove connections under an energy budget

sparse, task-relevant

one block

CLONE

duplicate the block and stack it (grow depth)

depth stack

block at one place

TRANSLATE

copy to every position — weights shared

tiled everywhere = convolution

one block type

RECOMBINE

swap in a different block where one kind won't do

mixed — two operations
